

**ONE SHOT. STERILIZED.**

## ViolaWave introduces **BULLET**

**BULLET** is a groundbreaking sterilization system specifically designed for microphones.

Equipped with a microprocessor that ends the sterilization process automatically according to the detected state of contamination.

The time of sterilization varies from 3 to 5 minutes.

It is compatible with the size of most microphones available on the market, both hand-held and studio microphones.

Thanks to the use of a series of ultraviolet lamps designed to produce a small amount of ozone (O<sub>3</sub>) safe for your microphones, it will be possible to sterilize even in areas where UV rays cannot reach. This will guarantee a much deeper and more complete cleaning of the entire microphone, not just the capsule.

Numbers of laboratory tests have shown that **BULLET** eliminates up to 99.9% of bacteria and viruses in no more than 5 minutes.

It's environmentally friendly and, unlike conventional spray disinfectants, does not contain chemicals. It deodorizes, reduces the risk of allergic reactions, and does not damage electronic components.

**BULLET**'s body is made of a special silicone formula, weighs only 300g, elastic, foldable, portable, it is ideal for activities such as conferences, TV, Radio, live performances, recording, karaoke, parties, religious events, etc. A convenient USB port allows you to fully charge the built-in battery in just 30 minutes or to operate **BULLET** while connected to an external power source. A purple light logo on the button indicates that the sterilization is in progress. It will blink red while charging and turn to solid red when full charge is completed

External measurements: length 258mm / 10.15in - diameter 70mm / 2.75in  
Internal measurements : length 220mm / 8.66in - diameter 63mm / 2.48in  
Weight (empty): 300g - 11oz
